This article discusses the integration of data on green areas in Geographical Information Systems. The special situation of Romania, in which, in the absence of laws and appropriate management of applications are returned impressive surfaces covered with forests and green areas in major cities. It is a actual issue in our country, involving both important legal aspects and aspects of computerization. It shows the main legislative provisions in this area and the need to adopt new regulations. In fact the main beneficiaries of such changes would be mainly citizens.

**Keywords** green areas, GIS, forests, legislative provisions
